

# **Database Systems: Design, Implementation, and Management**

## **Ninth Edition**

*Chapter 11*  
*Database Connectivity and Web  
Technologies*

# Database Connectivity

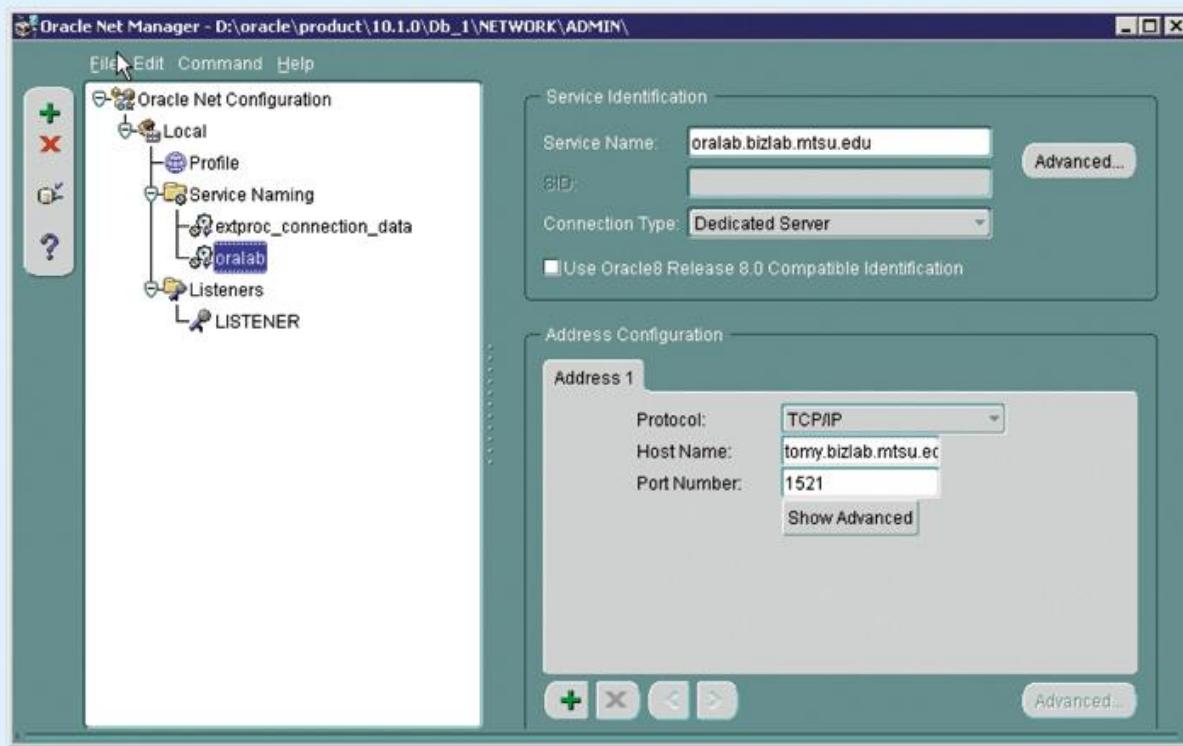

- Mechanisms by which application programs connect and communicate with data sources
  - Also known as **database middleware**
- Data repository:
  - Also known as a data source
  - Represents the data management application
    - Used to store data generated by an application program
- ODBC, OLE-DB, ADO.NET: the backbone of **MS Universal Data Access (UDA)** architecture

# Native SQL Connectivity

- Connection interface provided by database vendors
  - Unique to each vendor
- Example: Oracle RDBMS
  - Must install and configure Oracle's SQL\*Net interface in client computer
- Interfaces optimized for particular vendor's DBMS
  - Maintenance is a burden for the programmer

**FIGURE  
14.1**

**ORACLE native connectivity**

# ODBC, DAO, and RDO

- **Open Database Connectivity (ODBC)**
  - Microsoft's implementation of a superset of SQL Access Group **Call Level Interface (CLI)**
  - Widely supported database connectivity interface
  - Any Windows application can access relational data sources
  - Uses SQL via standard **application programming interface (API)**

# ODBC, DAO, and RDO (cont'd.)

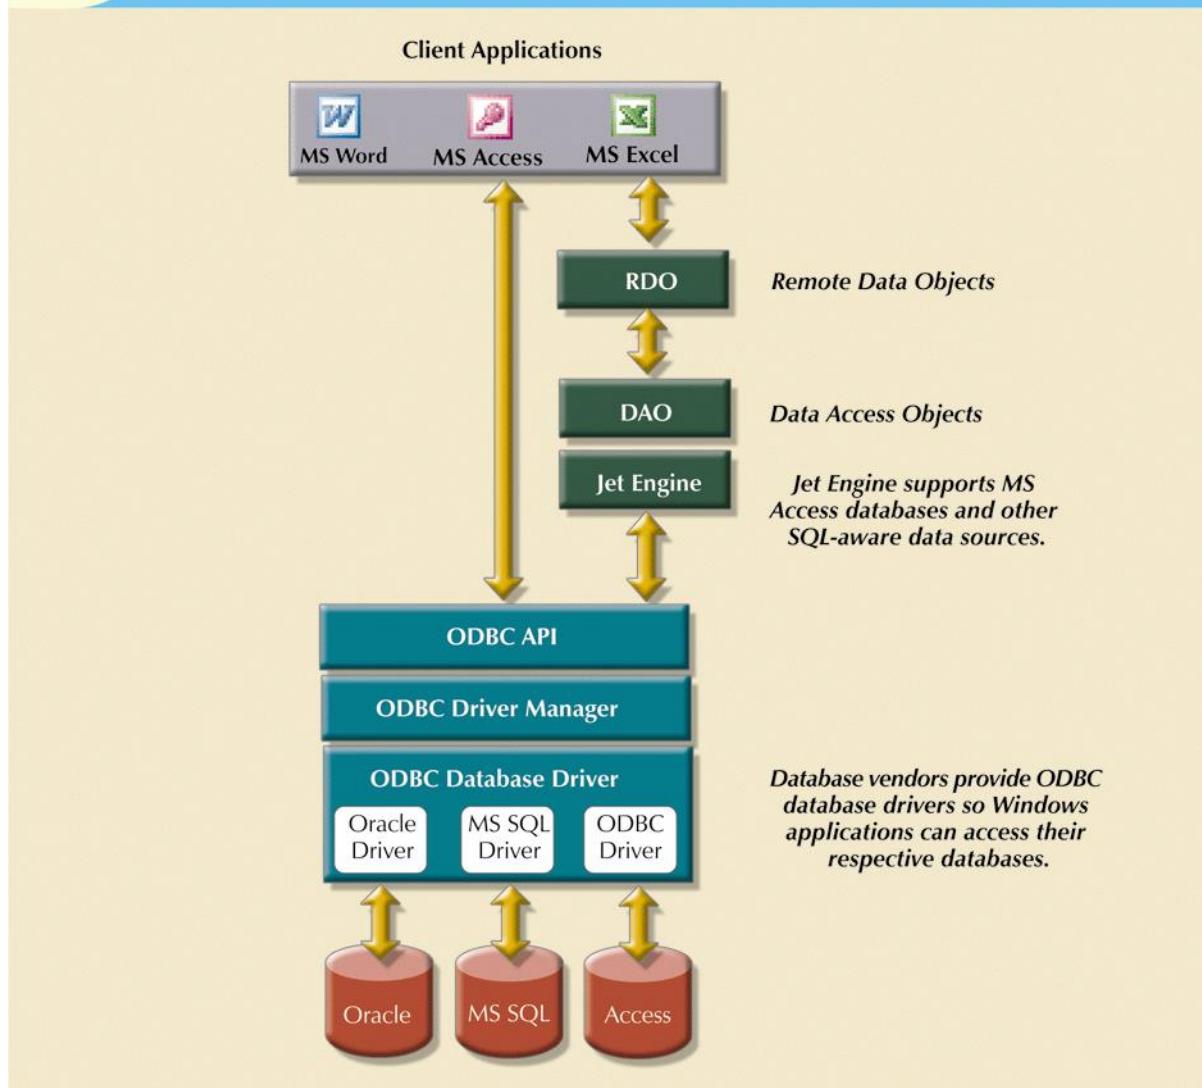

- **Data Access Objects (DAO)**
  - Object-oriented API
    - Accesses MS Access, MS FoxPro, and dBase databases from Visual Basic programs
  - Provided an optimized interface that exposed functionality of Jet data engine to programmers
  - DAO interface can also be used to access other relational style data sources

# ODBC, DAO, and RDO (cont'd.)

- **Remote Data Objects (RDO)**
  - Higher-level object-oriented application interface used to access remote database servers
  - Uses lower-level DAO and ODBC for direct access to databases
  - Optimized to deal with server-based databases, such as MS SQL Server, Oracle, and DB2
- Implemented as shared code dynamically linked to Windows via **dynamic-link libraries**

FIGURE  
14.2

Using ODBC, DAO, and RDO to access databases

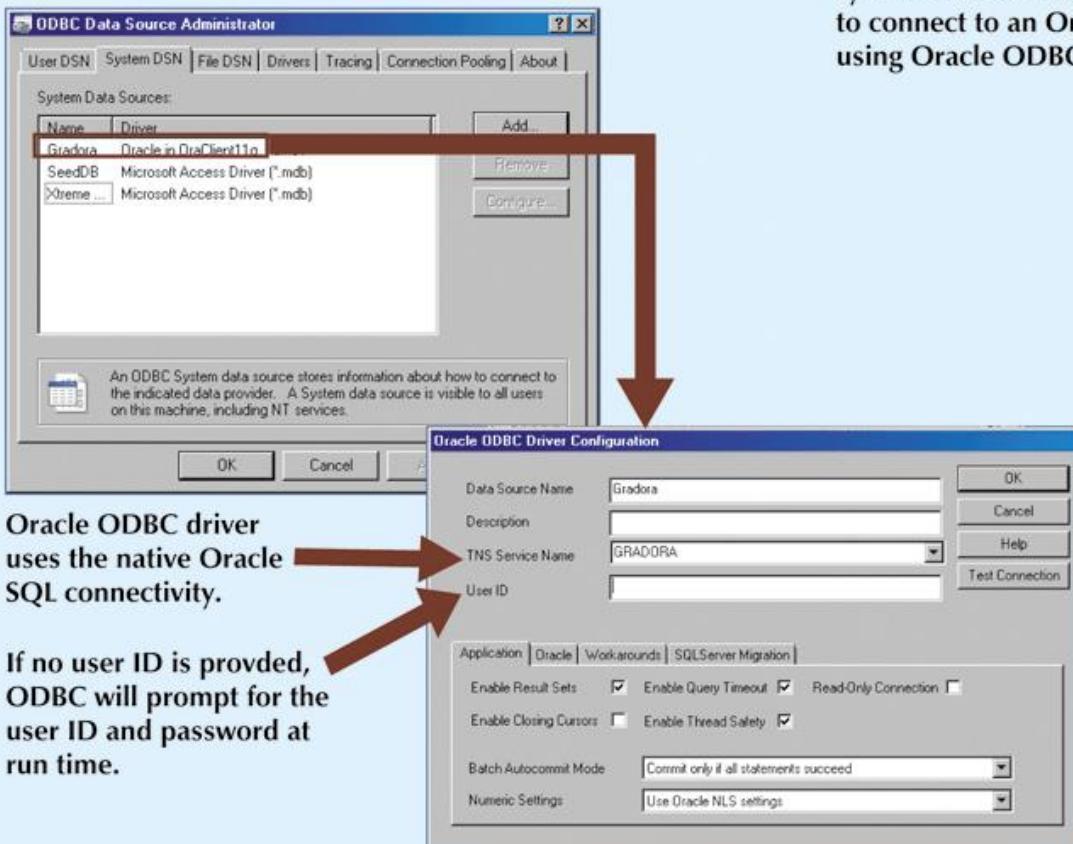

# ODBC, DAO, and RDO (cont'd.)

- Basic ODBC architecture has three main components:
  - High-level ODBC API through which application programs access ODBC functionality
  - Driver manager that is in charge of managing all database connections
  - ODBC driver that communicates directly to DBMS

**FIGURE  
14.3**

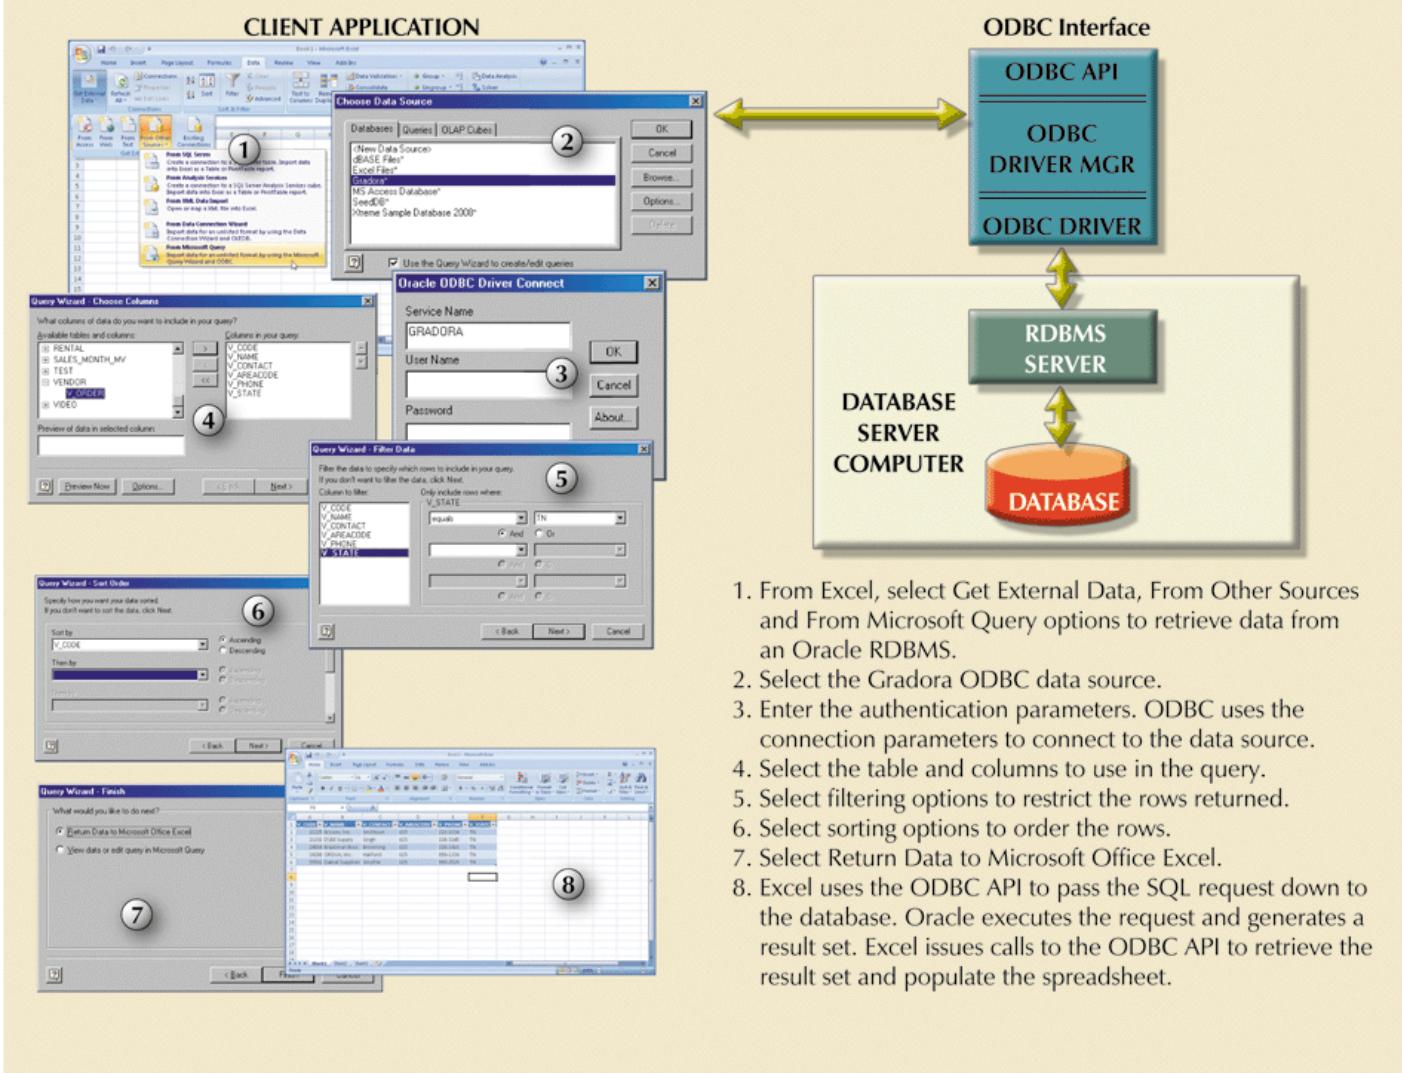

### Configuring an Oracle ODBC data source

Defining an ODBC system Data Source Name (DSN) to connect to an Oracle DBMS, using Oracle ODBC driver

**FIGURE  
14.4**

## MS Excel uses ODBC to connect to an Oracle database

# OLE-DB

- **Object Linking and Embedding for Database**
- Database middleware that adds object-oriented functionality for access to data
- Series of COM objects provides low-level database connectivity for applications
- Functionality divided into two types of objects:
  - Consumers
  - Providers

# OLE-DB (cont'd.)

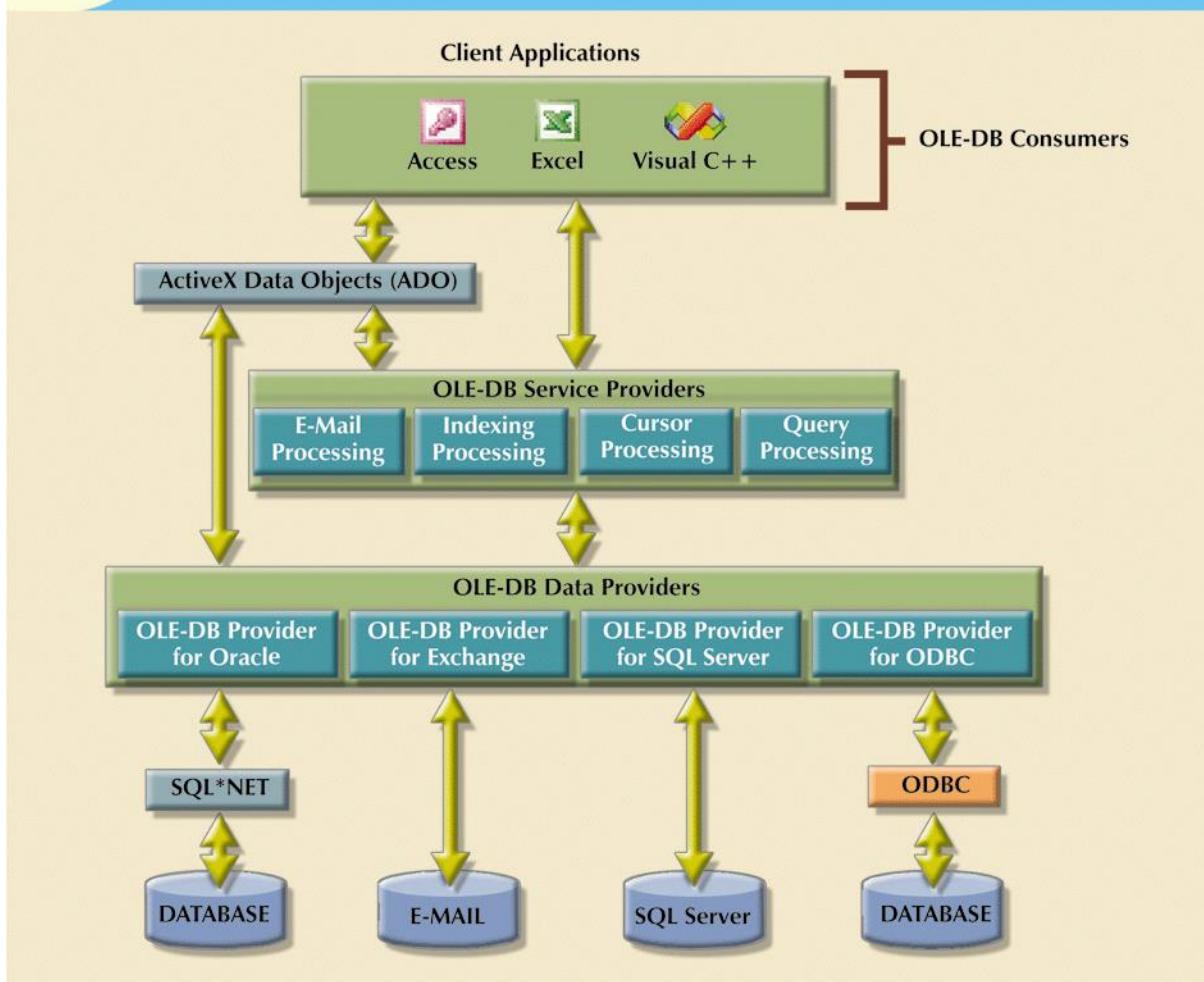

- OLE-DB did not provide support for scripting languages
- ActiveX Data Objects (ADO) provides high-level application-oriented interface to interact with OLE-DB, DAO, and RDO
- ADO provides unified interface to access data from any programming language that uses the underlying OLE-DB objects

**TABLE  
14.1****Sample OLE-DB Classes and Interfaces**

OBJECT CLASS	USAGE	SAMPLE INTERFACES
Session	Used to create an OLE-DB session between a data consumer application and a data provider.	IGetDataSource ISessionProperties
Command	Used to process commands to manipulate a data provider's data. Generally, the command object will create RowSet objects to hold the data returned by a data provider.	ICommandPrepare ICommandProperties
RowSet	Used to hold the result set returned by a relational-style database or a database that supports SQL. Represents a collection of rows in a tabular format.	IRowsetInfo IRowsetFind IRowsetScroll

FIGURE  
14.5

OLE-DB architecture

**TABLE  
14.2****Sample ADO Objects**

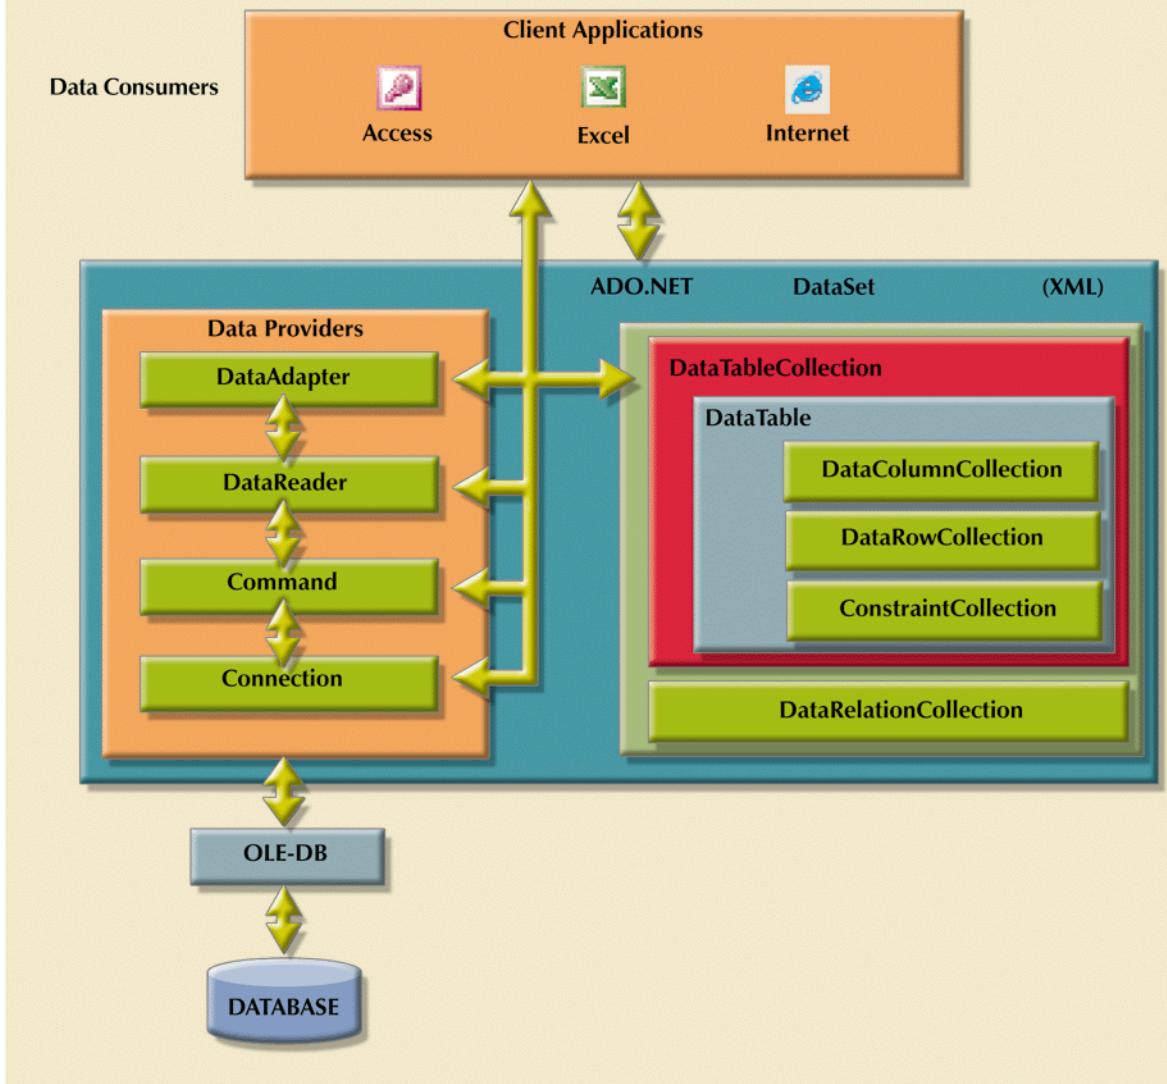

OBJECT CLASS	USAGE
Connection	Used to set up and establish a connection with a data source. ADO will connect to any OLE-DB data source. The data source can be of any type.
Command	Used to execute commands against a specific connection (data source).
Recordset	Contains the data generated by the execution of a command. It will also contain any new data to be written to the data source. The Recordset can be disconnected from the data source.
Fields	Contains a collection of Field descriptions for each column in the Recordset.

# ADO.NET

- Data access component of **Microsoft's .NET** application development framework
- Two new features for development of distributed applications:
  - **DataSet** is disconnected memory-resident representation of database
  - DataSet is internally stored in XML format
    - Data in DataSet made persistent as XML documents

**FIGURE  
14.6**

**ADO.NET framework**

# ADO.NET (cont'd.)

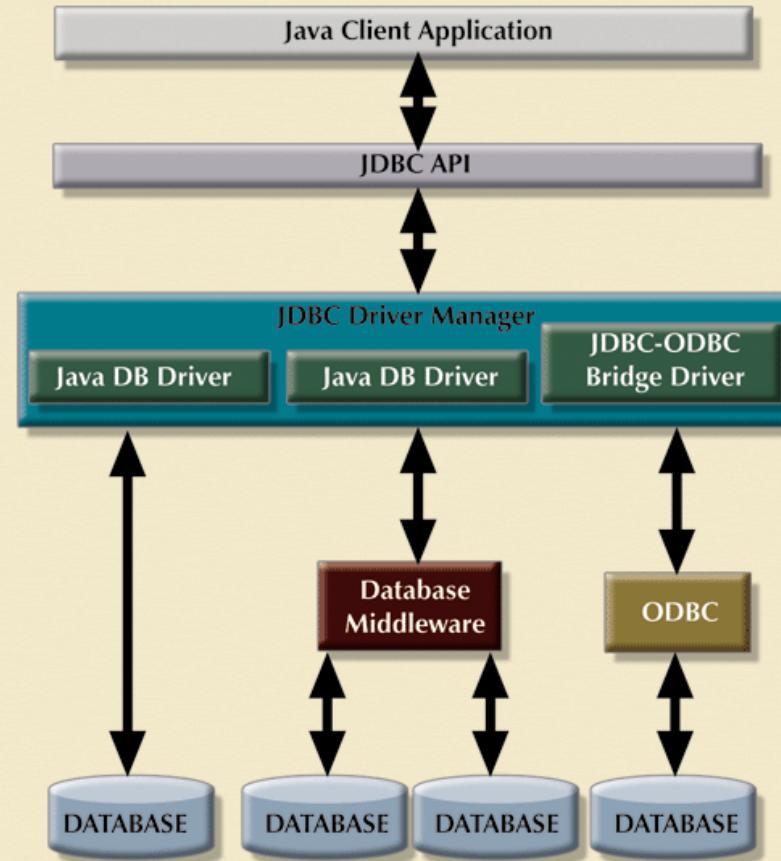

- Specific objects manipulate data in data source
  - Connection
  - Command
  - DataReader
  - DataAdapter
  - DataSet
  - DataTable

# Java Database Connectivity (JDBC)

- **Java** is an object-oriented programming language
  - Runs on top of Web browser software
- Advantages of JDBC:
  - Company can leverage existing technology and personnel training
  - Allows direct access to database server or access via database middleware
  - Provides a way to connect to databases through an ODBC driver

**FIGURE  
14.7**

**JDBC architecture**

# Internet Databases

- Web database connectivity allows new innovative services that:
  - Permit rapid response by bringing new services and products to market quickly
  - Increase customer satisfaction through creation of Web-based support services
  - Yield fast and effective information dissemination through universal access

**TABLE  
14.3****Characteristics and Benefits of Internet Technologies**

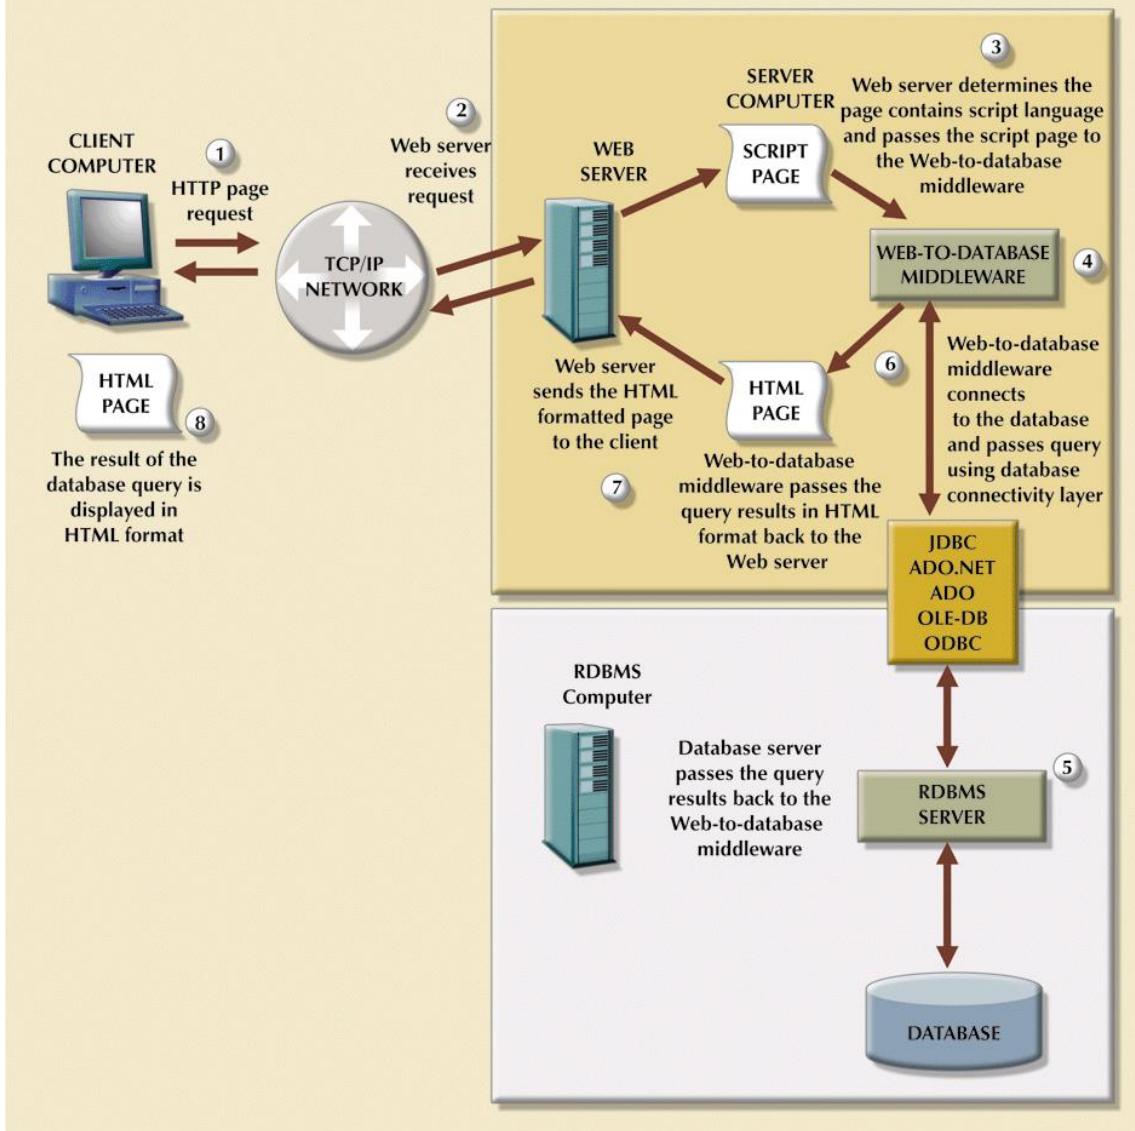

INTERNET CHARACTERISTIC	BENEFIT
Hardware and software independence	Savings in equipment/software acquisition Ability to run on most existing equipment Platform independence and portability No need for multiple platform development
Common and simple user interface	Reduced training time and cost Reduced end-user support cost No need for multiple platform development
Location independence	Global access through Internet infrastructure and mobile smart devices Reduced requirements (and costs!) for dedicated connections
Rapid development at manageable costs	Availability of multiple development tools Plug-and-play development tools (open standards) More interactive development Reduced development times Relatively inexpensive tools Free client access tools (Web browsers) Low entry costs. Frequent availability of free Web servers Reduced costs of maintaining private networks Distributed processing and scalability, using multiple servers

# Web-to-Database Middleware: Server-Side Extensions

- Web server is the main hub through which Internet services are accessed
- Dynamic Web pages are at the heart of current generation Web sites
- **Server-side extension:** a program that interacts directly with the Web server
  - Also known as **Web-to-database middleware**
- Middleware must be well integrated

FIGURE  
14.8

Web-to-database middleware

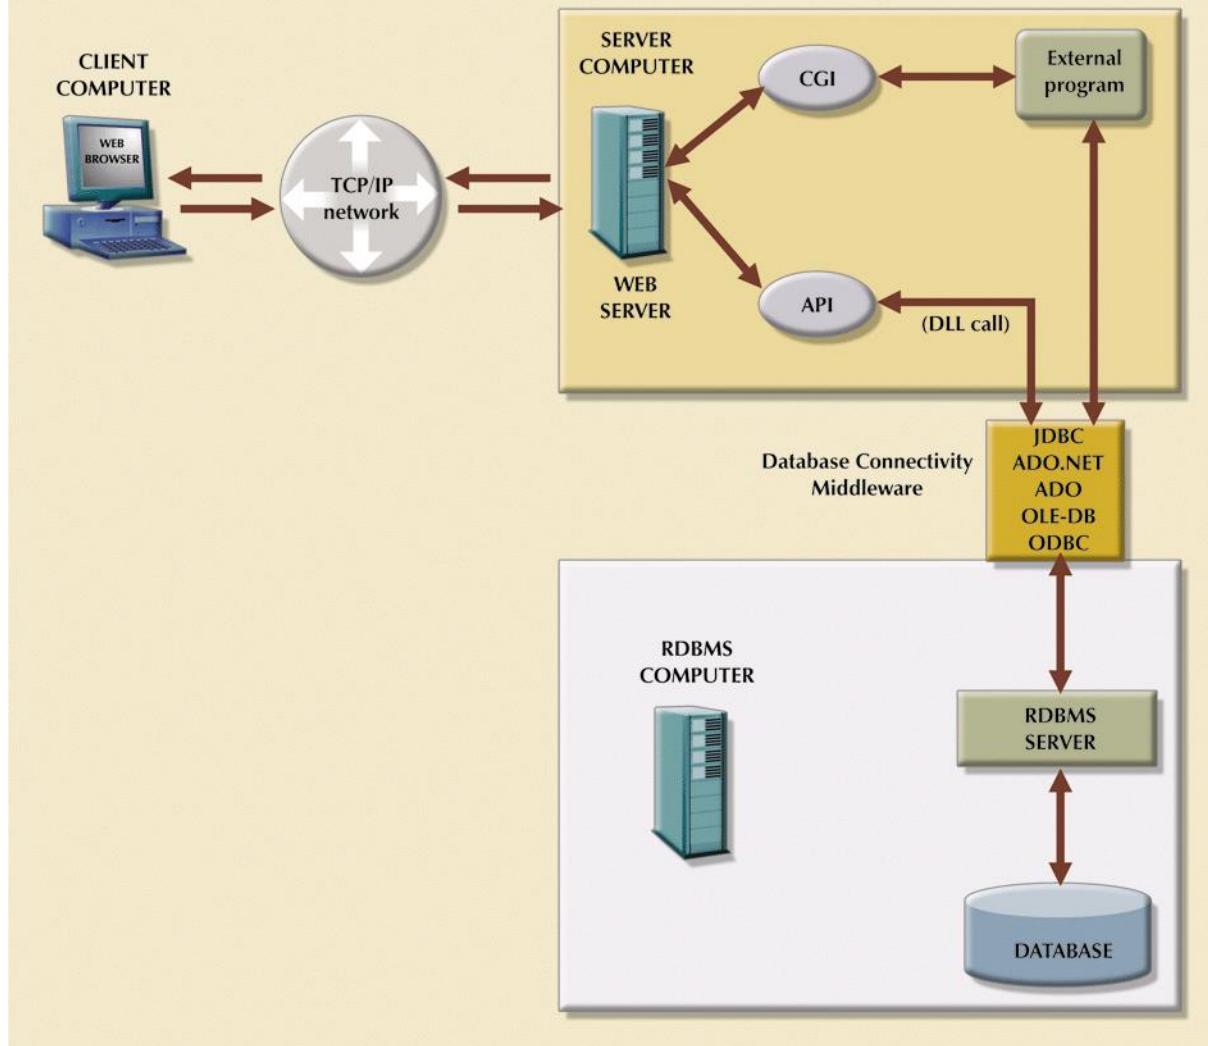

# Web Server Interfaces

- Two well-defined Web server interfaces:
  - **Common Gateway Interface (CGI)**
  - **Application Programming Interface (API)**
- Disadvantage of CGI scripts:
  - Loading external script decreases system performance
  - Language and method used to create script also decrease performance
- API is more efficient than CGI
  - API is treated as part of Web server program

**FIGURE  
14.9**

Web server CGI and API interfaces

# The Web Browser

- Software that lets users navigate the Web
- Located in client computer
- Interprets HTML code received from Web server
- Presents different page components in standard way
- Web is a **stateless system**: Web server does not know the status of any clients

# Client-Side Extensions

- Add functionality to Web browser
- Three general types:
  - Plug-ins
  - Java and JavaScript
  - ActiveX and VBScript

# Client-Side Extensions (cont'd.)

- **Plug-in:** an external application automatically invoked by the browser when needed
- **Java and JavaScript:** embedded in Web page
  - Downloaded with the Web page and activated by an event
- **ActiveX and VBScript:** embedded in Web page
  - Downloaded with page and activated by event
  - Oriented to Windows applications

# Web Application Servers

- Middleware application that expands the functionality of Web servers
  - Links them to a wide range of services
- Some uses of Web application servers:
  - Connect to and query database from Web page
  - Create dynamic Web search pages
  - Enforce referential integrity
- Some features of Web application servers:
  - Security and user authentication
  - Access to multiple services

# Extensible Markup Language (XML)

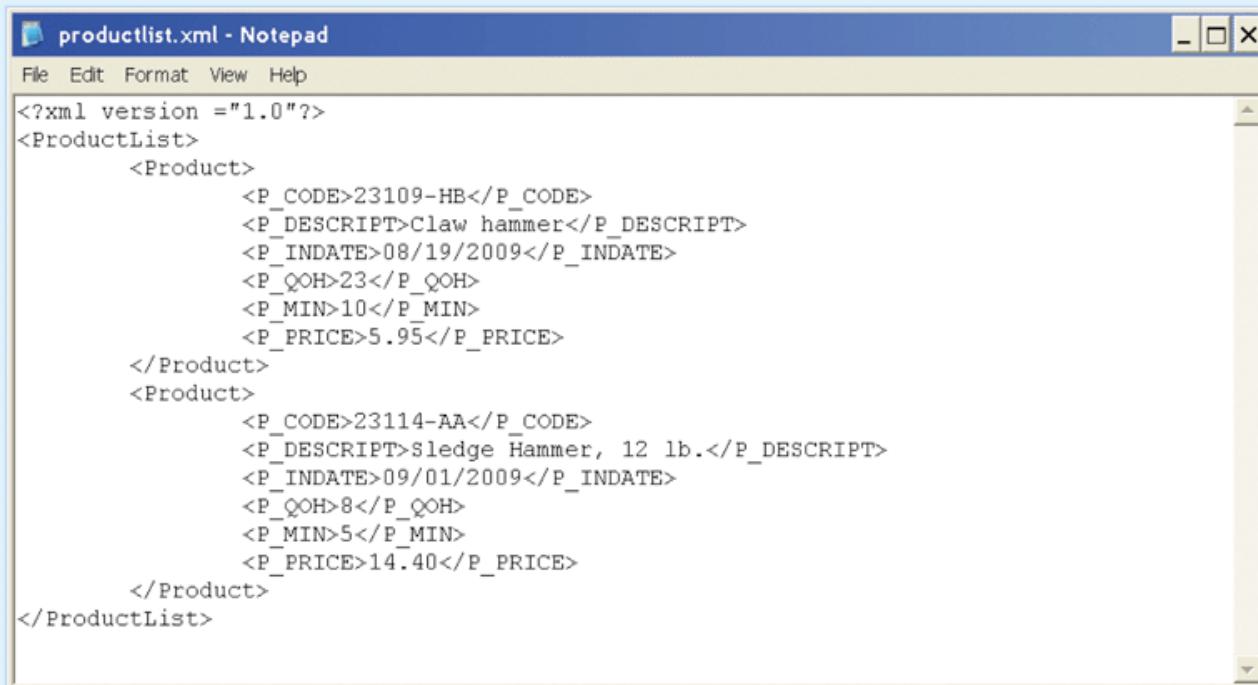

- Companies use Internet to create new systems that integrate their data
  - Increase efficiency and reduce costs
- Electronic commerce enables organizations to market to millions of users
- Most e-commerce transactions take place between businesses
- HTML Web pages display in the browser
  - Tags describe how something looks on the page

# Extensible Markup Language (XML) (cont'd.)

- **Extensible Markup Language (XML):**
  - Metalanguage to represent and manipulate data elements
  - Facilitates exchange of structured documents over the Web
  - Allows definition of new tags
    - Case sensitive
    - Must be well-formed and properly nested
    - Comments indicated with <- and ->
    - *XML* and *xml* prefixes reserved for XML tags only

**FIGURE  
14.10**

**Contents of the productlist.xml document**

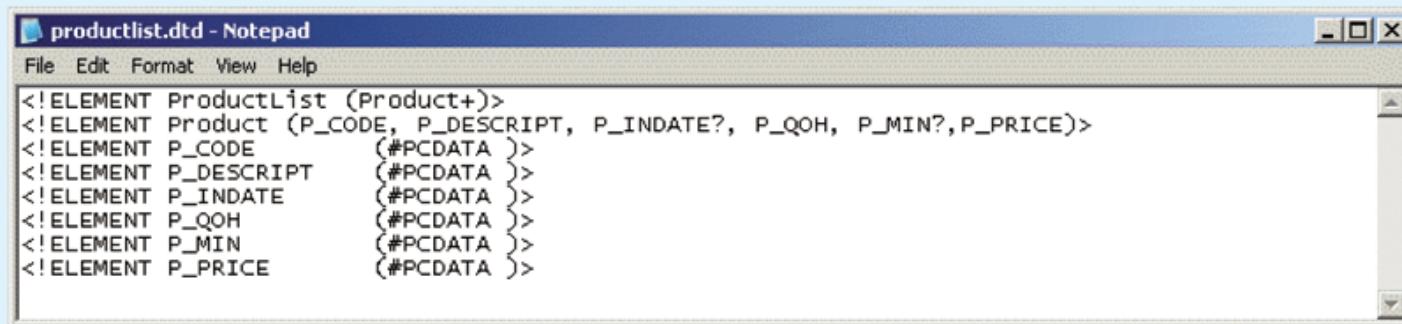

The screenshot shows a Windows Notepad window titled "productlist.xml - Notepad". The window contains the XML code for a product list. The XML structure includes a root element "ProductList" containing two "Product" elements. Each "Product" element has five child elements: "P\_CODE", "P\_DESCRIP", "P\_INDATE", "P\_QOH", and "P\_PRICE". The data for the first product is: P\_CODE=23109-HB, P\_DESCRIP=Claw hammer, P\_INDATE=08/19/2009, P\_QOH=23, P\_PRICE=5.95. The data for the second product is: P\_CODE=23114-AA, P\_DESCRIP=Sledge Hammer, 12 lb., P\_INDATE=09/01/2009, P\_QOH=8, P\_PRICE=14.40.

```
<?xml version = "1.0"?>
<ProductList>
    <Product>
        <P_CODE>23109-HB</P_CODE>
        <P_DESCRIP>Claw hammer</P_DESCRIP>
        <P_INDATE>08/19/2009</P_INDATE>
        <P_QOH>23</P_QOH>
        <P_MIN>10</P_MIN>
        <P_PRICE>5.95</P_PRICE>
    </Product>
    <Product>
        <P_CODE>23114-AA</P_CODE>
        <P_DESCRIP>Sledge Hammer, 12 lb.</P_DESCRIP>
        <P_INDATE>09/01/2009</P_INDATE>
        <P_QOH>8</P_QOH>
        <P_MIN>5</P_MIN>
        <P_PRICE>14.40</P_PRICE>
    </Product>
</ProductList>
```

# Document Type Definitions (DTD) and XML Schemas

- **Document Type Definition (DTD)**
  - File with .dtd extension that describes elements
  - Provides composition of database's logical model
  - Defines the syntax rules or valid tags for each type of XML document
- Companies engaging in e-commerce transaction must develop and share DTDs
- DTD referenced from inside XML document

**FIGURE**  
**14.11**      **Contents of the productlist.dtd document**

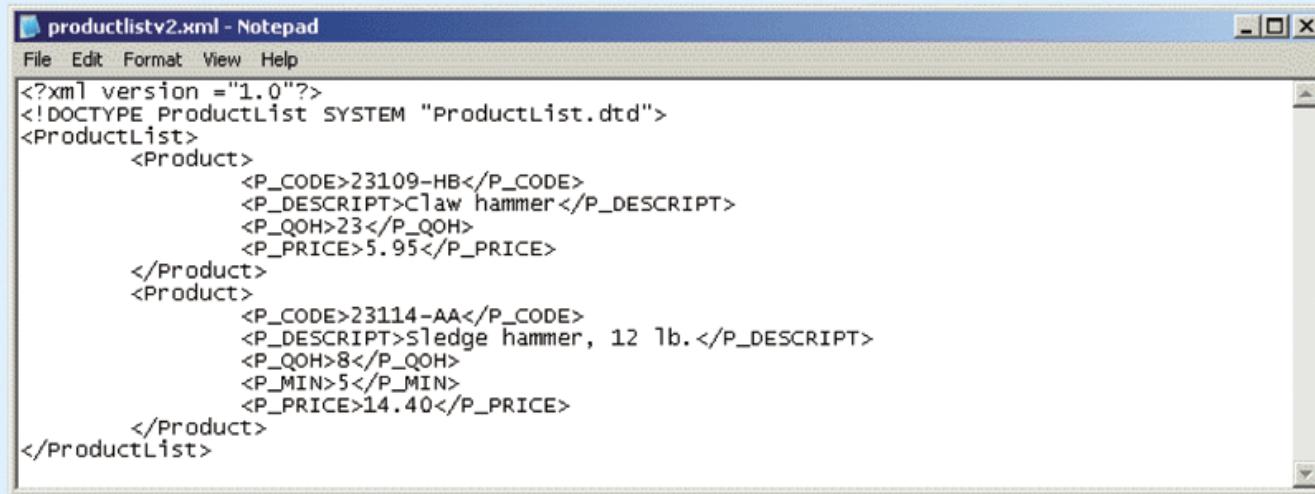

The screenshot shows a Microsoft Notepad window titled "productlist.dtd - Notepad". The window contains the XML DTD code for a product list. The code defines an element "ProductList" which contains zero or more "Product" elements. Each "Product" element has attributes: P\_CODE, P\_DESCRIP, P\_INDATE?, P\_QOH, P\_MIN?, and P\_PRICE. The attribute values are represented by "#PCDATA". The Notepad window has a standard Windows-style title bar and scroll bars.

```
<!ELEMENT ProductList (Product+)>
<!ELEMENT Product (P_CODE, P_DESCRIP, P_INDATE?, P_QOH, P_MIN?, P_PRICE)>
<!ELEMENT P_CODE      (#PCDATA )>
<!ELEMENT P_DESCRIP   (#PCDATA )>
<!ELEMENT P_INDATE    (#PCDATA )>
<!ELEMENT P_QOH       (#PCDATA )>
<!ELEMENT P_MIN       (#PCDATA )>
<!ELEMENT P_PRICE     (#PCDATA )>
```

**FIGURE  
14.12**

Contents of the productlistv2.xml document

The screenshot shows a Microsoft Notepad window titled "productlistv2.xml - Notepad". The window contains the following XML code:

```
<?xml version = "1.0"?>
<!DOCTYPE ProductList SYSTEM "ProductList.dtd">
<ProductList>
    <Product>
        <P_CODE>23109-HB</P_CODE>
        <P_DESCRIPTOR>Claw hammer</P_DESCRIPTOR>
        <P_QOH>23</P_QOH>
        <P_PRICE>5.95</P_PRICE>
    </Product>
    <Product>
        <P_CODE>23114-AA</P_CODE>
        <P_DESCRIPTOR>Sledge hammer, 12 lb.</P_DESCRIPTOR>
        <P_QOH>8</P_QOH>
        <P_MIN>5</P_MIN>
        <P_PRICE>14.40</P_PRICE>
    </Product>
</ProductList>
```

**FIGURE  
14.13**

DTD and XML documents for order data

**OrderData.dtd**

```
<!ELEMENT OrderData (ORD_ID,ORD_DATE,CUS_NAME,ORD_SHIPTO,ORD_PRODS*,ORD_TOT)>
<!ELEMENT ORD_ID      (#PCDATA )>
<!ELEMENT ORD_DATE    (#PCDATA )>
<!ELEMENT CUS_NAME    (#PCDATA )>
<!ELEMENT ORD_SHIPTO  (#PCDATA )>
<!ELEMENT ORD_PRODS   (P_CODE, P_DESCRIP, P_QOH, P_PRICE)+>
<!ELEMENT P_CODE       (#PCDATA )>
<!ELEMENT P_DESCRIP   (#PCDATA )>
<!ELEMENT P_QOH        (#PCDATA )>
<!ELEMENT P_PRICE      (#PCDATA )>
<!ELEMENT ORD_TOT     (#PCDATA )>
```

“+” sign indicates  
one or more  
ORD\_PRODS elements

**OrderData.xml**

```
<?xml version = "1.0"?>
<!DOCTYPE OrderData SYSTEM "OrderData.dtd">
<OrderData>
  <ORD_ID>34583</ORD_ID>
  <ORD_DATE>12/08/2009</ORD_DATE>
  <CUS_NAME>Jill Atkins</CUS_NAME>
  <ORD_SHIPTO>1234 Crown Rd, Chicago, IL34564</ORD_SHIPTO>
  <ORD_PRODS>
    <P_CODE>2309-HB</P_CODE>
    <P_DESCRIP>Claw Hammer</P_DESCRIP>
    <P_QOH>2</P_QOH>
    <P_PRICE>5.95</P_PRICE>
  </ORD_PRODS>
  <ORD_PRODS>
    <P_CODE>23114-AA</P_CODE>
    <P_DESCRIP>Sledge Hammer, 12 lb.</P_DESCRIP>
    <P_QOH>1</P_QOH>
    <P_PRICE>14.40</P_PRICE>
  </ORD_PRODS>
  <ORD_TOT>26.30</ORD_TOT>
</OrderData>
```

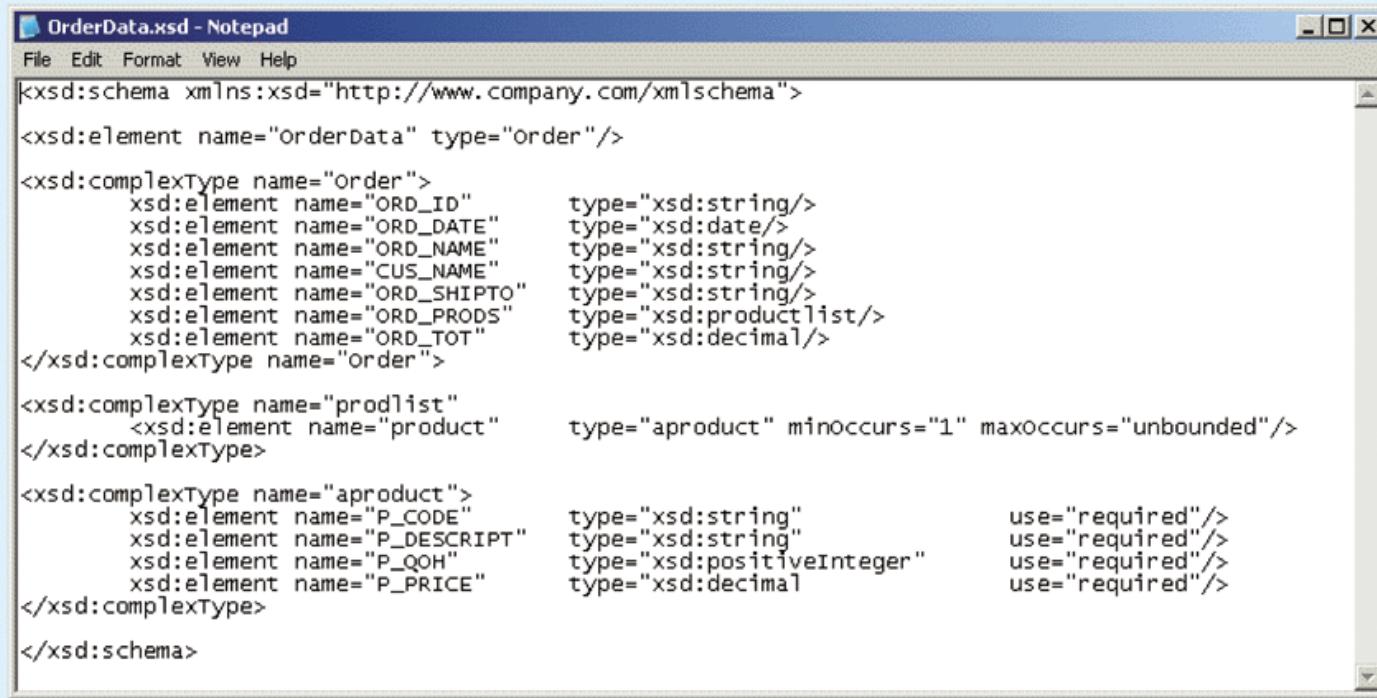

Two ORD\_PRODS  
elements in XML  
document

# Document Type Definitions (DTD) and XML Schemas (cont'd.)

- **XML schema**
  - Advanced data definition language
  - Describes the structure of XML data documents
- Advantage of XML schema:
  - More closely maps to database terminology and features
- **XML schema definition (XSD) file** uses syntax similar to XML document

**FIGURE  
14.14**

The XML schema document for the order data

The screenshot shows a Microsoft Notepad window titled "OrderData.xsd - Notepad". The window contains an XML schema definition for "order data". The schema defines a root element "OrderData" of type "Order". The "Order" type is a complex type containing elements "ORD\_ID", "ORD\_DATE", "ORD\_NAME", "CUS\_NAME", "ORD\_SHIPTO", "ORD\_PRODS", and "ORD\_TOT", each with its corresponding type (xsd:string, xsd:date, xsd:string, xsd:string, xsd:string, xsd:productlist, xsd:decimal). It also defines a "prodlst" type which contains a single "product" element with a minoccurs of 1 and maxOccurs of unbounded, and an "aproduct" type which contains four elements: "P\_CODE", "P\_DESCRPT", "P\_QOH", and "P\_PRICE", each with its type (xsd:string, xsd:string, xsd:positiveInteger, xsd:decimal) and a use attribute set to required. The schema ends with a closing "

```
<xsd:schema xmlns:xsd="http://www.company.com/xmlschema">

<xsd:element name="OrderData" type="Order"/>

<xsd:complexType name="Order">
    <xsd:element name="ORD_ID" type="xsd:string"/>
    <xsd:element name="ORD_DATE" type="xsd:date"/>
    <xsd:element name="ORD_NAME" type="xsd:string"/>
    <xsd:element name="CUS_NAME" type="xsd:string"/>
    <xsd:element name="ORD_SHIPTO" type="xsd:string"/>
    <xsd:element name="ORD_PRODS" type="xsd:productlist"/>
    <xsd:element name="ORD_TOT" type="xsd:decimal"/>
</xsd:complexType>

<xsd:complexType name="prodlst">
    <xsd:element name="product" type="aproduct" minOccurs="1" maxOccurs="unbounded"/>
</xsd:complexType>

<xsd:complexType name="aproduct">
    <xsd:element name="P_CODE" type="xsd:string" use="required"/>
    <xsd:element name="P_DESCRPT" type="xsd:string" use="required"/>
    <xsd:element name="P_QOH" type="xsd:positiveInteger" use="required"/>
    <xsd:element name="P_PRICE" type="xsd:decimal" use="required"/>
</xsd:complexType>

</xsd:schema>
```

# XML Presentation

- XML separates data structure from presentation and processing
- Extensible Style Language (XSL) displays XML data
  - Defines the rules by which XML data are formatted and displayed
  - Two parts:
    - Extensible Style Language Transformations (XSLT)
    - XSL style sheets

**FIGURE  
14.15**

Framework for XML transformations

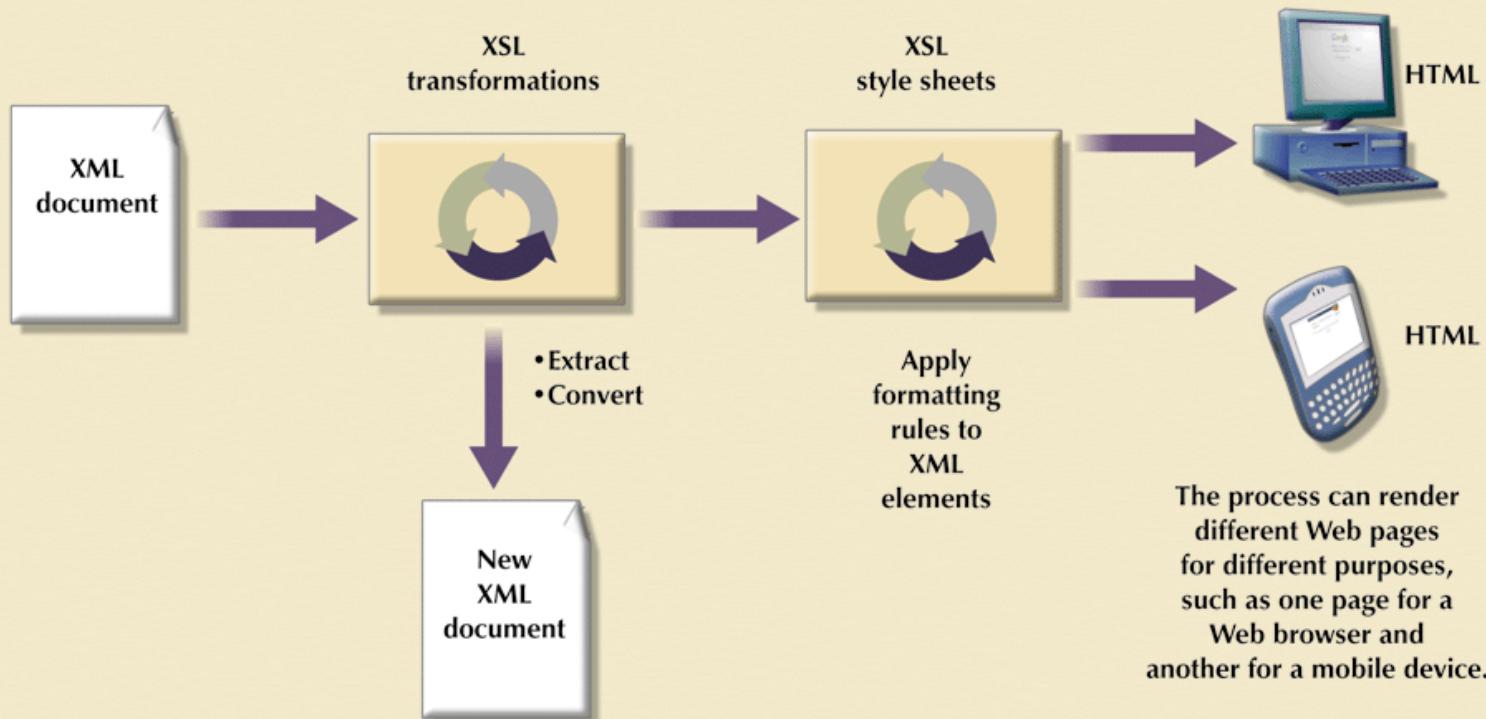

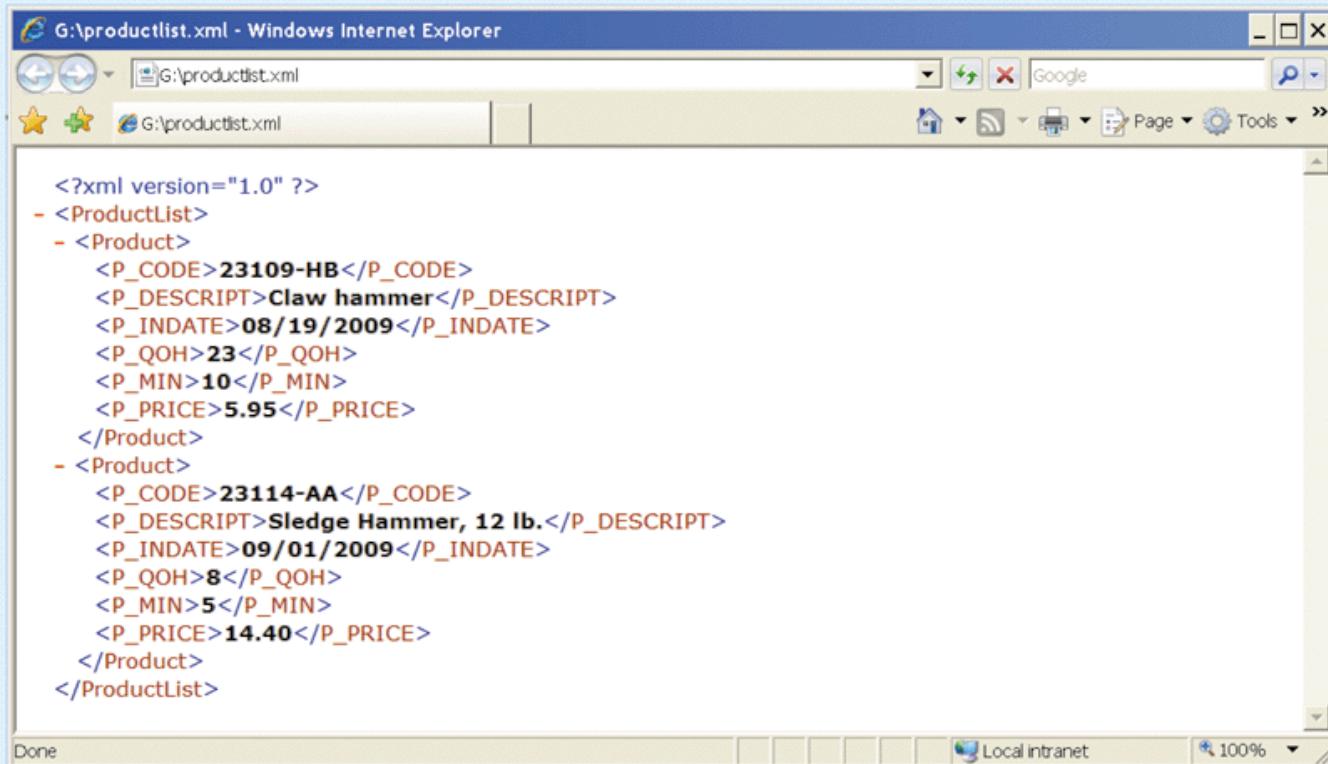

FIGURE  
14.16

Displaying XML documents

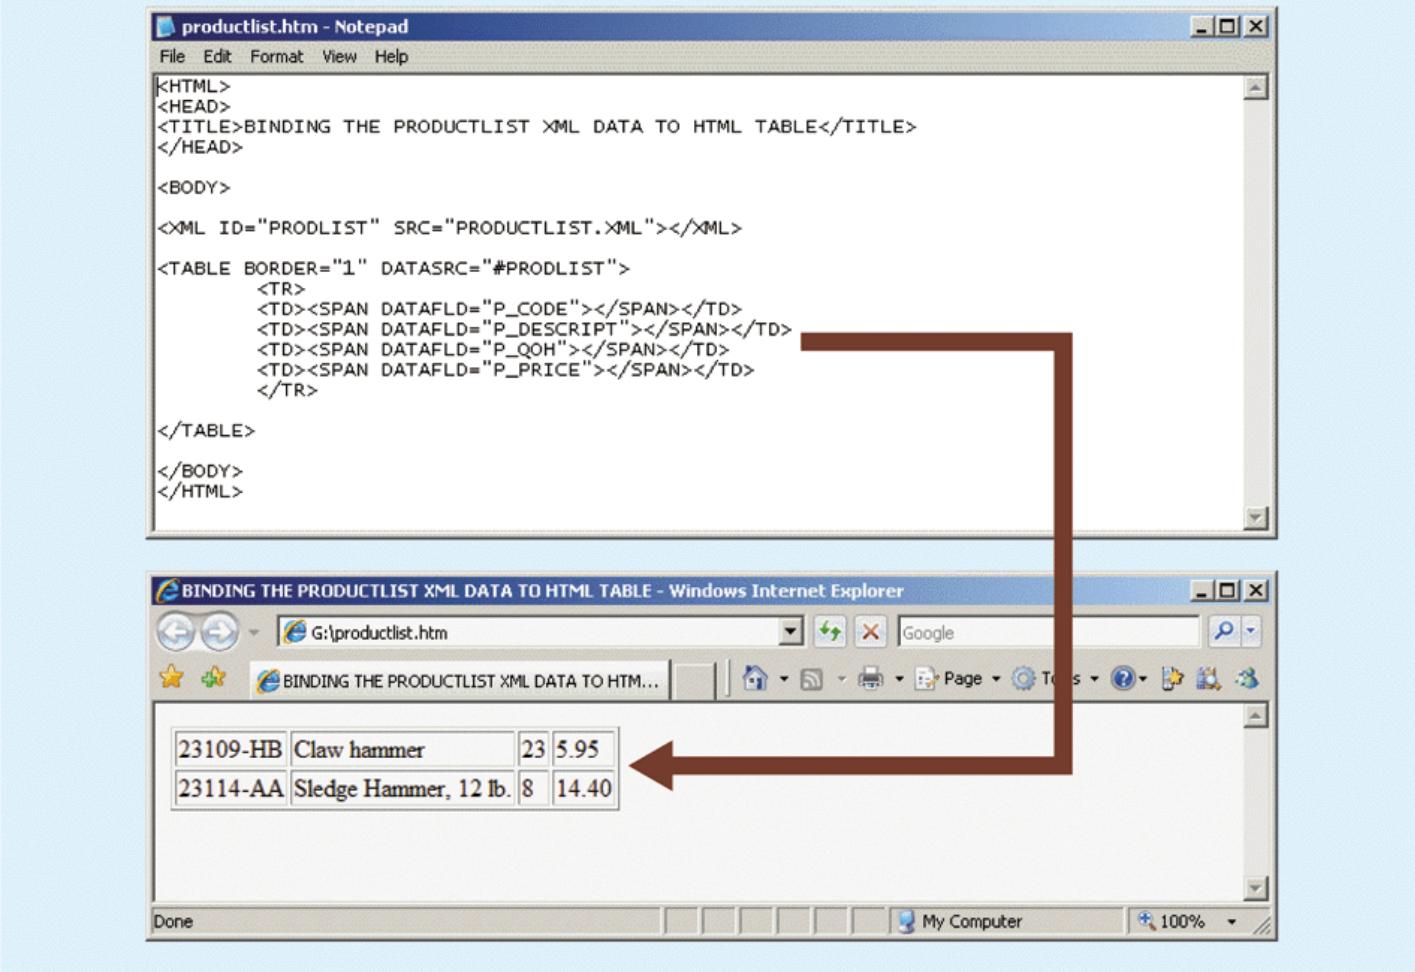

The screenshot shows a Windows Internet Explorer window with the title bar "G:\productlist.xml - Windows Internet Explorer". The address bar shows "G:\productlist.xml". The main content area displays the XML code for a product list:

```
<?xml version="1.0" ?>
- <ProductList>
- <Product>
  <P_CODE>23109-HB</P_CODE>
  <P_DESCRIP>Claw hammer</P_DESCRIP>
  <P_INDATE>08/19/2009</P_INDATE>
  <P_QOH>23</P_QOH>
  <P_MIN>10</P_MIN>
  <P_PRICE>5.95</P_PRICE>
</Product>
- <Product>
  <P_CODE>23114-AA</P_CODE>
  <P_DESCRIP>Sledge Hammer, 12 lb.</P_DESCRIP>
  <P_INDATE>09/01/2009</P_INDATE>
  <P_QOH>8</P_QOH>
  <P_MIN>5</P_MIN>
  <P_PRICE>14.40</P_PRICE>
</Product>
</ProductList>
```

**FIGURE  
14.17**

**XML data binding**

# XML Applications

- B2B exchanges
- Legacy systems integration
- Web page development
- Database support
- Database meta-dictionaries
- XML databases
- XML services

# SQL Data Services

- Provides relational data management to companies of any size
- Avoids high cost of personnel/maintenance
- Leverages Internet to provide:
  - Hosted data management
  - Standard protocols
  - A common programming interface
- Could assist businesses with limited information technology resources
